SIVER DATA

ELECTRONIC MEASURING SYSTEMS FOR
CAR BODY REPAIR*
44957AED

**ELECTRONIC MEASURING SYSTEMS
Siver Data can be used in the following cases:**

For measurements during the process of collision repair. When it's impossible to detect visually the condition of the car body and it needs an documental approval. The measuring system provides noncontact multidimensional measuring by fixing pointer's position and further 3D modeling. Siver Data incorporates the principle of binocular vision: like a human eye, when we need to determine distance to the object. Two cameras located at the ends of the measuring beam perform "eyes function". As soon as contrast object (LED lights located in special order on the target) appears into the field of view of two cameras, the system accurately computes 3D coordinates. SIVER DATA performs point-to-point measurements quickly and accurately. The system provides 1 mm accuracy of measurements.
